As nuclear medicine physicians are the future heart specialists, this study was designed to investigate if there exists any relation between the choice of career and specialty that they aim for. All nuclear medicine physicians working in our country in the year 2010 were asked for an informed consent. The participants who had at least a 2-year work experience in different centers were chosen. The questionnaire consisted of three parts. The demographic data was collected from all the participants. The second part consisted of questions concerning their specialty choice. In the third part, they had to respond to Likert-type questions concerning the criteria that would influence their choice of specialty. Nuclear medicine physicians with more years of clinical practice were more likely to choose oncology. The third significant predictor for choosing oncology was the desire to work in the area of cardiology (p = 0.014). As nuclear medicine physicians are the future heart specialists, it

Field of the Invention The present invention relates to a semiconductor laser having an active layer and a current constriction layer which are adjacent and a light absorption layer which is adjacent to the current constriction layer, and to an optical pickup device provided with the semiconductor laser. 2. Description of the Related Art As one of the problems related to a semiconductor laser, it is known that crosstalk occurs when a portion where the active layer overlaps the current constriction layer is larger than a threshold value and light is transduced in the current constriction layer. For example, a first related art (see, e.g. Japanese Patent Laid-Open No. H04-57377 (Page 3, FIG. 2)) discloses a semiconductor laser which includes an active layer formed on a substrate, a pair of side surfaces of the active layer, and a refractive index difference portion provided on each of the pair of side surfaces. The refractive index difference portion is formed of a first layer which is located in a first position where a light ray passes through and in which the refractive index is lower than that of the active layer, and a second layer which is located in a second position where the light ray passes through and in which the refractive index is higher than that of the active layer. The first layer is provided on the side surface of the active layer located in the first position and extends in a direction perpendicular to the light ray passing through the first position. The second layer is provided on the side surface of the active layer located in the second position and extends in a direction perpendicular to the light ray passing through the second position. The refractive index difference portion located in the first position is larger than that located in the second position. A second related art (see, e.g. Japanese Patent Laid-Open No. H04-6304 (6d1f23a050
